

PRESS RELEASE

For immediate release

Knick Drills 6.65 Meters of 94.40 Grams per Tonne Gold At Its Trecesson Property

Val d’Or, Québec, Canada, June 15, 2017 Knick Exploration Inc. (“Knick”) is pleased to announce results from its first two holes on the second phase of drilling on the company’s 100% owned Trecesson Property-Cossette gold system area.

Hole Number	From Meters	To Meters	Width Meters	Width Feet	Gold g/t	Gold oz/ton	Silver g/t	Silver oz/ton	Pb %
TR-17-01	65.30	67.50	2.20	7.22	3.23	0.094			
including	65.30	66.00	0.70	2.30	9.09	0.265	29.70	0.87	3.49
TR-17-02	45.30	51.95	6.65	21.82	94.40	2.756			
including	49.05	49.80	0.75	2.56	828.18	24.182	218.00	6.37	0.37
	73.95	77.20	3.25	10.66	0.29	0.008			

All core widths are down hole widths.

Hole **TR-17-01** was drilled on Section 5391600N beneath hole TR-11-119 from Knick’s 2011 drill campaign. The section is where Knick’s 2011 phase I program was completed. Hole TR-11-119 had down hole intersections of 22.86g/t over 1.55m at a vertical depth of 5.6m and 95.72g/t over 0.02m at a vertical depth of 15m (previously reported Aug. 23, 2011). Hole TR-17-01 intersected the gold zone at 53 meters vertical.

The hole TR-17-02 was drilled 20 meters north along strike of TR-117-01 and intersected the gold zone at 33 meters vertical depth.

The Cossette gold zone is an assemblage of quartz veins and dykes hosted in granitic rocks of the metalliferous Trecesson “batholith”. The batholith covers approximately 42km² and is host to gold, silver, tungsten, copper, zinc and lead mineralization. In 2011, drilling by Knick of the Cossette zone encountered true widths of the zone up 3.27 meters, Hole TR-11-61 returned 14.22g/t gold over 3.237m, previously reported¹.

Compared with the company’s 2011 drill campaign where the veining system was encountered up to 3.27 meters, true width, the 2017 drilling has intersected the zone with down hole widths up to 16 meters, an estimated true width of 12 meters. Knick cautions investors that the width of zone intersected represent the host structure and may or may not be mineralized in part or whole. Knick is anticipating its **phase III drill program** on the Trecesson Property later this year.

The property is located approximately 80 kilometers north and 10 kilometers northwest of the cities of Val D'Or and Amos, Quebec, Canada, respectively. A total of 33 holes have been completed for a total of 3,203.6 meters of core drilled. Logging and sampling of the core is ongoing.

Results from Knick's 2011 first phase of drilling gold highlights included: **14.22g/t over 3.80m** (0.415oz/ton over 12.46ft), **22.69g/t over 1.95m** (0.663oz/ton over 6.4ft) and **22.86g/t over 1.55m** (0.667oz/ton over 5.08ft), all core widths are down hole widths. These results were previously reported along with others in Knick's news release of Aug. 16, 2011.

Samples were sent to Expert Laboratory in Rouyn-Noranda, Quebec for analysis. Fire assay and metallic sieve methods were implemented for analysis as deemed warranted.

Due to the nature of the native gold mineralization occurring on the Trecesson Property, Metallic Sieve gold analysis was performed on all quartz veining to minimize "nugget effect" results and more accurately assess gold grades.
