PRESS RELEASE

For immediate release

**GOLD MINERALIZATION  
OF THE TRECESSON PLUTON-  
MASTER THESIS POSTED**

**Val-d'Or, Quebec, November 30, 2017, – Knick Exploration Inc. (TSX-V: KNX)** is pleased to report that Mr. George Yordanov, BSc, MSc, completed his master's thesis, *Minéralisations Aurifères du Pluton de Trecesson*, which is posted on the company's website via this link <http://www.knick.ca/files/2017/M14811.pdf>.

Mr. Yordanov completed his Masters' studies at the University of Montreal on the Trecesson Pluton including age dating, petrographic work and relative comparisons with the Bourlamaque Batholith. Alain Tremblay, Phd. was the acting supervisor for Mr. Yordanov's Thesis.

**Of particular note are:** Figure 4.9 page 64, an example of a new exploration drill target area developed from the research; Figure 3.20, page 47 and Figure 3.21, page 47 relative age dates and genesis of this area of the gold prolific Abitibi Greenstone Belt; **Table 4, page 78 comparison** between the **Trecesson pluton** and the **Bourlamaque pluton**. An example from the table: Trecesson age date  $2711 \pm 1.2$  million (present study) and Bourlamaque  $2700 \pm 1$  million years (Wong et al.1991).

The **Trecesson Pluton** is host to numerous gold showings most of which have been subjected to little work since the early 1950's. The showings occur within and near the margins of the Pluton. Mineralization encountered in Knicks' 2011 and 2017 drill program showed similarities to the ores from the Bourlamaque Batholith.

The **Bourlamaque Batholith**, host to at least **9 known gold deposits** in the Val d'Or mining camp, gave rise to producers and past producers including the Ferderber and Beaufor gold mines.

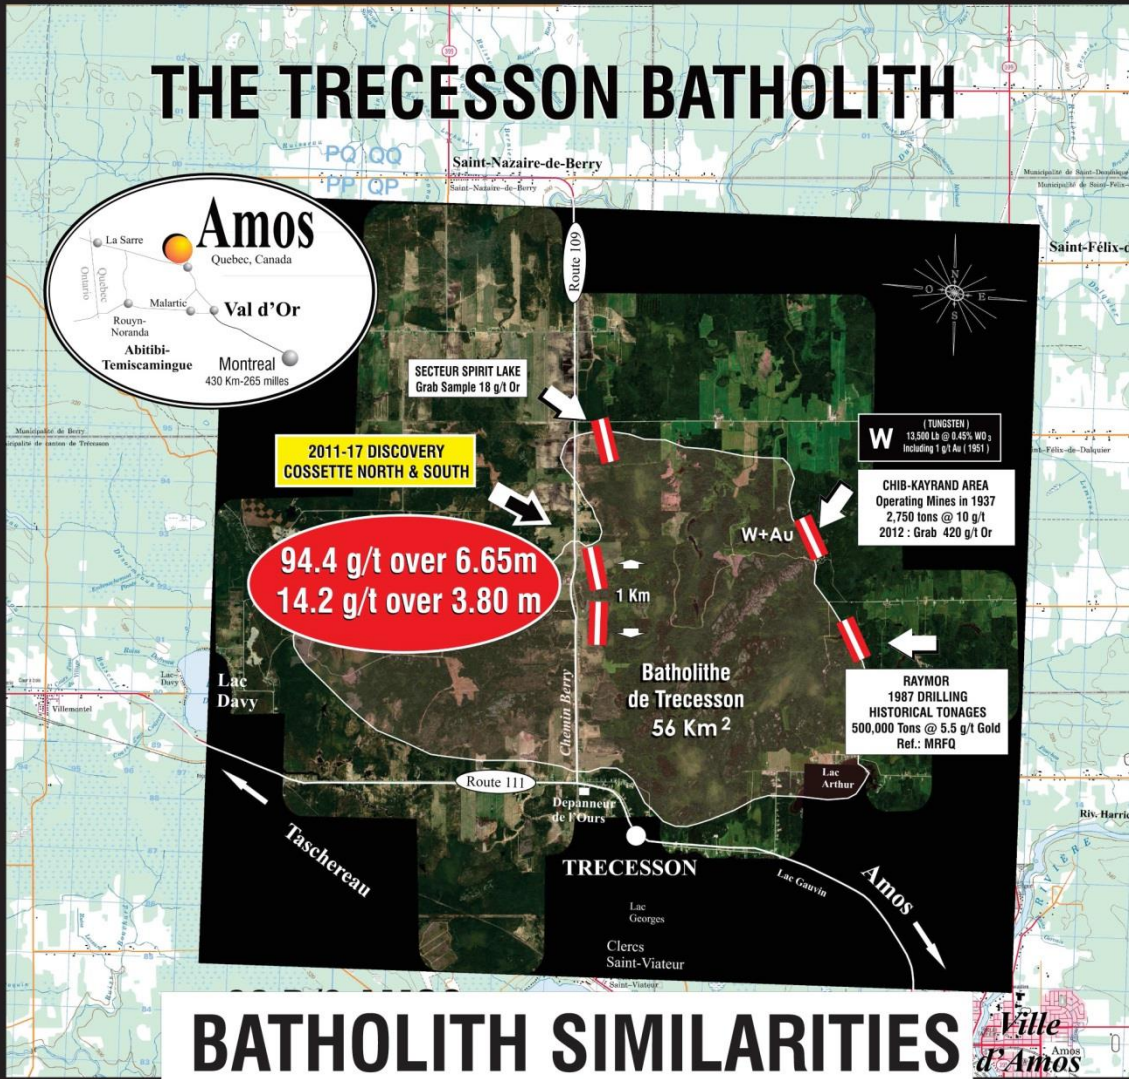

The Trecesson property covers approximately 75 km<sup>2</sup> including the 56 km<sup>2</sup> of the Trecesson Pluton. It is located approximately 70 kilometers north and 10 kilometers northwest of the cities of Val d'Or and Amos, Quebec, Canada, respectively.
