## TRECESSON PROPERTY-COSSETTE GOLD AREA IP SURVEY RESULTS POSITIVE

Val-d'Or, Quebec, September 12, 2017 – Knick Exploration Inc. (TSX-V: KNX) (“Knick Exploration” or “the Company”) is pleased to announce the induced polarization (IP) survey by Remy Belanger Geophysics on the Trecesson property Cossette gold system area were positive.

A total of 7.325 kilometers of survey were completed across 1.0 kilometers of strike length. “Definite” anomalies, having similar signatures, associated with the Cossette System were encountered, including where drilling returned values of **94.4 g/t gold** over **6.65 meters** and **10.5 g/t gold** over **1.20 meters** on the south and north Cossette zones, respectively. The survey proved the effectiveness of IP in tracing the Cossette gold system along strike and locating possible similar parallel mineralized structures.

Anomalies defined along strike of the Cossette gold system are considered high priority targets as well as several anomalies located peripheral to the system. The upcoming phase III drill program will test priority IP targets, and the Cossette gold system at depth.

The Trecesson property is located approximately 80 kilometers north of the city of Val D'Or and 10 kilometers northwest of the city of Amos, Quebec, Canada.

Drill results are down hole widths and were previously reported, June 15, 2017 and Aug. 23, 2011.
