PRESS RELEASE

For immediate release

## METALLURGY TEST ON KNICK'S TUNGSTEN ASSETS

**Val-d'Or, Quebec, January 29, 2014, – Knick Exploration Inc. (TSX-V: KNX)** is pleased to report that research into the historic documentation on its tungsten assets of the Trecesson Property has revealed a **1955 report on metallurgical testing** of the **number 9 vein** material indicating **positive results** in producing a favourable **tungsten tri-oxide (WO<sub>3</sub>) concentrate**.

From the 1955, Quebec Tungsten limited report: “some **larger scale tests** on the ore from **Quebec Tungsten Limited**, for the **purpose** of obtaining more **constant operation**, a **larger amount of WO<sub>3</sub> concentrate** and a **procedure** more nearly **parallel to plant operation** than could be obtained in the small scale laboratory tests. These **larger scale tests** have now been made using approximately **500 lbs** of ore for each test.” The **objective** of the test was to raise the grade of the **scheelite concentrate** to the **acceptable figure** of **60% WO<sub>3</sub> for direct sale**. “This was **obtained** with a **concentrate** running **63.5% WO<sub>3</sub>** but the recovery fell off. However, the **middling** and **tailings** from the cleaner table operation could be **ground** and **re-tabled** and with a **recovery** from them of **50%** of the **tungsten** it would bring the **overall recovery close to 70%**.”(Reference MNRQ: GM4150-C).

The **number 9 vein** has been traced for a strike length of 450 meters and has reported widths up to 7 meters. Initial **2013** grab samples results from “Vein No. 9” by Knick ran **0.64%, 0.63%** and **0.55% tungsten tri-oxide** and a grab sample that assayed **420.37g/t gold** returned **0.2% tungsten-trioxide** (previously reported).

World demand for tungsten is continuing to increase. China controls approximately 80% of the market followed by the former USSR with about 8%. Typical grades for **tungsten** are **0.3 to 1.5% tungsten tri-oxide** for veins, lower for stockworks.

The property is located 12 km north of the town of **Amos** and approximately 65 km north northwest of **Val d' Or, Quebec**. The Trecesson Gold Property is traversed by paved and all weather gravel roads making it accessible year round.

Grab samples are selective by nature and are unlikely to represent the average grade of the mineralized zone.

Samples were sent to Expert Laboratory in Rouyn-Noranda, Quebec for analysis. Fire assay, multi element scan and XRF method were implemented for analysis.

Standards and blanks are submitted by Knick routinely to insure quality control.

Gordon N. Henriksen, P.Geo., Vice President of Knick Exploration, is the Company's qualified person as defined by National Instrument 43-101. He has reviewed and approved the contents of this press release.

We seek Safe Harbour.
